

E-MAIL ARCHIVING

CLEAR THE CLUTTER

ENHANCE E-MAIL STORAGE

Continued growth in e-mail and e-mail attachment volume, combined with increased attention to regulatory compliance and corporate governance demands a strategic solution to manage and store e-mail data.

Alphanumeric's e-mail archiving solutions help organizations manage ever-growing quantities of e-mail data, improve storage efficiency and security, ensure compliance with corporate policies and external regulators' guidelines, and enable better disaster recovery by centralizing storage. Prioritized storage provides a secure and accessible housing for recent and archived e-mail and files, while providing a cost-effective and easy-to-navigate data organization system.

ORAGE AND RECOVERY

ELIMINATE QUOTAS

By implementing a centralized archiving solution, companies can provide mailboxes which are virtually limitless in their capacity. Current corporate e-mail is safely stored on high-performance disks, while archived mail and data is stored on less expensive storage, where it can be restored if needed.

ELIMINATE LOCAL ARCHIVES

Restricted by storage quotas, end-users might save archived e-mail to local PCs where the data is unsecure, and if the hard drive failed, would be completely lost. Centrally stored e-mail archives, by contrast, are secure, accessible and transparent to end-users.

ERADICATE PST FILES

Trade insecure Personal Storage Table (.pst) files, for centralized archiving to enable easier e-mail access to end-users, decrease storage requirements for local hard disk drives, and ensure regulatory compliance.

ENSURE COMPLIANCE

With centrally managed policies, and automated, centralized storage, companies can more completely adhere to corporate or regulatory e-mail and data storage policies. Easier, more reliable and secure access to archived files also makes proving compliance easier, and ensures continued compliance in the event of hard drive failure or other disasters at the end-user level.

SUPPORT BUSINESS CONTINUITY

Archiving reduces the amount of data stores on the production mail server, reducing time required to discover data and improving the efficiency of data recovery.
